LEIF JAY B. DE SAGUN, PhD
Adviser

Accepted and approved in partial fulfillment of the requirements for the degree of **BACHELOR OF SCIENCE IN INFORMATION TECHNOLOGY**.

Date of Oral Defense: December 2024

LEIF JAY B. DE SAGUN, PhD
Dean

ABSTRACT

This study presents a pet administration and wellness system for NDV Pet Lovers, addressing the issues of operational efficiency and service quality. The system centralizes the record for client and product management, appointment schedules, billing transactions, and reports. It features user authentication, on time tracking for appointments, track low-stock levels and dashboard for monitoring. With an intuitive and formal interface, the system's purpose is to improve user experience, improve efficiency, and optimize operations, enhancing administration and workflow. To ensure efficient development and focus on ease of use and scalability, the system uses RAD (Rapid Application Development) methodology.

Findings from the survey showed that 65% of participants felt assured and discovered it. simple to operate the system. The majority of users appreciate the system's effectiveness and its capability to minimize manual tasks. Nonetheless, reliability in the system and the necessity for technical assistance continue to be issues. According to the results, suggestions included making complex features simpler and enhancing usability. and functioning of the system. This project showcases the potential for the system to enhance clinic. operations, lessen burdens, thus enhancing pet healthcare management.

CHAPTER I

INTRODUCTION

A. Rationale of the Study

NDV Pet Lovers, a specialized veterinary clinic, faces several challenges in its current system that impact both operational efficiency and service quality. These challenges include product management for stock items and medicines, accurately recording client pet information, spending excessive time searching for specific records, misplacing records, and encountering errors in data entry. These issues not only burden the staff with manual work, such as data entry and retrieval, but also lead to inefficiencies and inaccuracies. In the latter, this also affect the quality of service provided to clients and the overall operationality of healthcare services in the veterinary clinic. If these issues are not resolved, NDV Pet Lovers will continue to experience suboptimal service quality, inefficiencies, and difficulties in managing client and product records.

To address the current manual operations at the veterinary clinic and improve efficiency, a new system is being developed. The primary goals of this system are to optimize operations, enable faster input of patient information, and correct errors more easily. Additionally, the system will include a product management component to help the user monitor sales and product availability. Existing systems lack tailored solutions for the pet care industry, making adaptation difficult. Furthermore, these systems often struggle to manage and track large amounts of data, leading to operational issues.

Introducing the new system at NDV Pet Lovers Clinic will greatly benefit the staff by enhancing the scheduling process, resulting in smoother and more efficient client service. This will be achieved by eliminating double bookings and reducing the time spent on appointment management. Additionally, the system will provide staff with easy access to treatment overviews, the ability to add records for each client, the capacity to track scheduled

appointments, and access to billing details. With these improvements provided by establishment of the system, gains a refined and efficient operational framework, allowing staff to dedicate more time to delivering quality healthcare services to clients. Correspondingly, the new system will decrease the likelihood of errors in record-keeping and data entry, ensuring more accurate patient information and billing processes. This will not only save time but also enhance the overall reliability and professionalism of the clinic's services.

To effectively manage records, products, appointment schedules and reports for billing and consultation, NDV Pet Lovers clinic requires a robust management system. The system's scope will focus on essential functionalities to address immediate challenges, with the possibility of future enhancements based on evolving needs and technological advancements in the pet care industry. However, potential constraints, such as limited expertise in implementing new systems and potential resistance to change, need to be considered. These constraints will be addressed through thorough research to fill gaps, allowing the focus on essential features. Accordingly, efficient development processes will be implemented to meet the project timeline.

B. Objectives of the System

The researchers aim to design and develop a web-based pet clinic management system, with the following objectives:

- Enhance billing processes to ensure accurate and efficient financial transactions.
- Simplify record-keeping and file management to ensure easy access and organization of pet and client information.
- Optimize appointment for follow-up check-ups scheduling to improved clinic workflow and client management.

- Improve product management to track and maintain sufficient stock of supplies and medicines.
- Generate detailed reports to analyze clinic performance and make informed decisions and enhancement of user workflow.

C. Significance of the Study

The implementation of the pet clinic management system offers benefits to the following entities:

NDV Pet Lovers Veterinary Clinic. The system can improve overall performance in managing records, inventory, scheduled appointments, and reports for the clinic.

Staff. The system simplifies meeting requirements and completing paperwork for staff, enhancing their efficiency.

Pet Owners/Pets. The system enhances the client experience by providing improved optimized appointment scheduling and efficient service quality.

Researchers. The system provides insights into enhancing clinic quality and serves as a knowledge base for system development.

Future Researchers. The conducted research study can serve as a reference and guide for future researchers conducting similar studies.

D. Scope and Limitations of the System

The pet clinic management system offers the following functionalities:

Client File Management. The system enables the registration and modification of pet owners and pet's profile, ensuring comprehensive record-keeping client and pet information, and facilitating user profile management.

Record tracking. The system includes functionality for monitoring, organizing, and managing records to ensure easy accessibility and retrieval when needed.

Product Record Management. The system includes functionality for managing the products such as pet food, accessories, and medicines. It allows user to add products, sales, product categories, quantities, with automated reminders for low stock level of products and medicines.

Billing Reports. It facilitates the billing process by providing insights for services, products and generating invoices and history transaction receipts.

Appointments. It enables user to book and manage appointments for follow-up pet checkups and vaccinations, with automated reminders located to the dashboard.

Monitoring Dashboard. It enables the user to view and track on time Appointment visits and Inventory Status.

However, the system has the following limitations:

Lack of online payment integration. The system lack the functionality to handle electronic payments, which are essential for efficient transactions.

Lack of user account registration. The system will not allow registration for new user accounts outside the system to maintain record confidentiality.

Lack of generating service certification. The system will not have the capability to generate service certifications such as travel and vaccinations.

Lack of generating printed receipts. The system will not be able to generate printed billing receipts.

CHAPTER II

I. Theoretical Background

A. Review of Related Systems

The review of related software aims to explore and evaluate existing software solutions related to the Pet Administration and Wellness System for the NDV Pet Lovers Veterinary Clinic. This analysis aims to identify and assess similar software applications that have been implemented in other Animal Hospitals, focusing on their features, functionalities, and overall effectiveness. By examining these related software systems, valuable insights can be gained to inform the development and enhancement of the proposed Pet Administration and Wellness System for the NDV Pet Lovers Veterinary Clinic.

1. ACESoft Business Manager

Figure 1 : Dashboard of ACESoft Business Manager

ACESoft is a practice management solution designed for veterinarians. It helps users to manage both operational as well as clinical aspects of their practices. The software is deployed on-premise and runs on Windows operating systems[1].

ACESoft features a patient module which allows users to capture patient data, contacts, medical charts and documentation. When a chart is created, users can add patient notes including diagnosis and treatment plans. The medical record also includes animal condition, procedure selection, intake dates and patient invoices[1].

ACESoft offers a prescription management module that allows practitioners to record provider details, treatment dates, expiration dates and refills. Once a prescription is created, users can print or email the document to the patient. Procedure forms allow users to record procedures and associated costs[1].

When compared to Pet Administration and Wellness System system for NDV Pet Lovers Clinic, ACESoft Business Manager offers similar features focused on managing operational and clinical aspects of veterinary practices. However, PAWS differs in several key ways. Firstly, while ACESoft is deployed on premise and limited to Windows operating systems, Pet Administration and Wellness System is web-based, offering greater accessibility and scalability. This allows users to access the system from any browser and adjust in responsiveness that makes it easier to scale as the clinic grows. Additionally, PAWS aims to streamline inventory management, and enhance overall operational efficiency that ACESoft Business does not have. Integrating features from ACESoft, such as detailed patient data capture and prescription management, could further enhance the functionality of our system, providing a comprehensive solution for veterinary clinics.

2. Rapport

Figure 2 : Dashboard of Rapport

Rapport is a practice management software for a more seamless practice and pet owner experience. Enhancing the client's communications and help reduce no-shows, improve client relations, and generate time and efficiency savings for your the staffs[2].

There is a wide range of tools to help simplify the client's interactions while also reducing administrative inefficiencies. Some key features of rapport include Automated treatment and appointment reminders, Mobile capabilities for both clinic users and pet parents, Client satisfaction surveys, and Two-way multi-media messaging[2].

When compared to Pet Administration and Wellness System for NDV Pet Lovers Clinic, Rapport offers client communication tools and a stronger emphasis on improving client experience. However, it lacks features such as inventory management, tracking records, and billing, which are crucial for overall clinic management. Additionally, Pet Administration and Wellness System's web-based nature allows for greater accessibility and scalability compared to Rapport's on premise deployment.

3. Clinic HQ

Figure 3 : Dashboard of Clinic HQ

Clinic HQ is a cloud-based solution that helps pet clinics schedule appointments, process payments and manage billing operations. It allows professionals to access patients' medical records, create treatment plans, and generate custom reports[3].

Features of Clinic HQ include calendar management, employee scheduling, mobile access, prescription processing, a self-service portal and more. The application enables employees to accept payments through several methods including credit and debit cards. Additionally, it lets administrators streamline accounting, invoicing, and data storage management processes via a unified platform[3].

While there are some similarities in terms of appointment scheduling, prescription processing, and responsiveness, Pet Administration and Wellness System offers additional functionalities such as inventory management, record-keeping, and automated billing, which are crucial for enhancing operational efficiency and service quality in veterinary clinics. Additionally, Pet Administration and Wellness System's focus on inventory management and record-keeping sets it apart from Clinic HQ, providing a more comprehensive solution tailored to the specific needs of pet clinics. Overall, while

Clinic HQ offers several useful features, our system offers a more complete and tailored solution for NDV Pet Lovers Clinic.

4. Adiuvet

Figure 4 : Dashboard of Adiuvet

Adiuvet is an Italian web-based veterinary practice management software designed to help Veterinarians and veterinary clinics of all sizes manage their daily operations[4].

Adiuvet offers key features like electronic medical records, appointment scheduling, billing, and inventory management. It has an integrated electronic prescription module and pharmaceutical formulary. The software also offers automatic data backup and security capabilities[4].

Adiuvet allows businesses to collect, store and manage patients' data in a centralized repository for reference. Support is provided via email and an online form[4].

Adiuvet and Pet Administration and Wellness System offer similar features such as appointment scheduling, billing, record tracking and inventory management. However, Pet Administration and Wellness System focuses on enhancing operational efficiency and service quality through features such as real-time inventory tracking, and

comprehensive client record management. Additionally, Adiuvet uses Italian language to the system making it only be useful if the user has language comprehension. Overall, while Adiuvet offers a range of useful features, our system provides a more tailored solution for NDV Pet Lovers Clinic.

5. Cassadol Equine

Figure 5 : Dashboard of Cassadol Equine

Cassadol Equine is a veterinary software designed to help businesses track animals' medical records and manage client invoicing. The platform enables managers to access clients' history, generate bills, set up appointments, and communicate with clients[5].

Cassadol Equine allows teams to track drugs and vaccinations and process payments via credit cards. Additionally, operators can also utilize rich text formatting functionality and file attachments to manage medical records[5].

Despite the features offered such as accessing client's history records, generating bills, setting up appointment schedules, and facilitating client communication, it lacks functionalities for inventory management and responsiveness. Additionally, Pet Administration and Wellness System is designed specifically for pet clinics, offering a

more tailored and specialized solution compared to Cassadol Equine, which may be more generalized. Overall, while Cassadol Equine provides useful functionalities for veterinary businesses, Pet Administration and Wellness offers a more comprehensive and specialized solution for NDV Pet Lovers Clinic.

B. Matrix of Comparison

A matrix of comparison serves as a valuable tool for evaluating and comparing various applications based on their features and functions. This matrix allows for a structured and organized representation of key attributes and capabilities of different applications side by side, enabling users to easily identify similarities and differences. By analyzing the matrix, users can make informed decisions about which application best aligns with their specific requirements and preferences. Ultimately, the comparison matrix simplifies the process of assessing and selecting the most suitable application for a particular purpose.

System/ Function	AceSoft Business Manager	Rapport	Clinic HQ	Adiuvet	Cassadol Equine	PAWS: Pet Administration and Wellness System
Responsiveness		✓	✓			✓
Product Record Management	✓			✓		✓
Client Record Management	✓		✓	✓	✓	✓
Transaction	✓			✓		✓
Billing Reports	✓		✓	✓	✓	✓
Tracking Records	✓		✓	✓	✓	✓
Appointment Scheduling	✓	✓	✓	✓	✓	✓

Table 1 : PAWS: Pet Administration and Wellness System Matrix of Comparison

C. Definition of Terms

NDV Pet Lovers Clinic. NDV Pet Lovers Clinic is a veterinary clinic that provides healthcare services for pets. It is a specialized clinic dedicated to the well-being and health maintenance of pets, offering services such as check-ups, vaccinations, and treatment for various pet health issues.

Pet Administration and Wellness System (PAWS). PAWS is a comprehensive system designed for the management and administration of pet-related services. It includes functionalities such as appointment scheduling, record-keeping for pets and owners, inventory management for pet supplies and medications, billing and payment processing, and other features aimed at enhancing the overall care and management of pets in a veterinary clinic setting.

Pet Clinic Management System. A pet clinic management system is a software application designed to help veterinary clinics and pet care facilities manage various aspects of their operations. It typically includes features such as appointment scheduling, electronic medical records for pets, inventory management for medications and supplies, billing and invoicing, and reporting functionalities to track clinic performance and finances.

Web-based Application. A web-based application is a software application that is accessed and used through a web browser over the internet. Users do not need to install the application on their local device but can access it remotely, making it convenient for users to use the application from any location with internet access. Web-based applications can range from simple websites to complex systems with advanced functionalities and database integration.

CHAPTER III

METHODOLOGY

A. Research Design

a. Research Environment

The researchers will conduct their study at NDV Pet Lovers Clinic, located at 29 Carlock St. San Nicolas, Cebu City, Cebu 6000, Philippines. NDV Pet Lovers Clinic is a welcoming environment for animal care and treatment. The proposed system will be used by the resident doctor of the clinic.

Figure 6 : Clinic of NDV Pet Lovers Clinic

Figure 7 : Clinic of NDV Pet Lovers Clinic office

b. Research Map

Figure 8 : Research Map of NDV Pet Lovers Clinic

c. Methods and Techniques

With the identified sources of data, the researchers will employ the following methods and techniques:

Rapid Application Development (RAD) Method. The researchers will use RAD to expedite the software development process, promote collaboration, and adapt to changing requirements.

Interviewing Technique. Interviews will be conducted to gather insights and information from stakeholders involved in pet clinic management.

Document Analysis. Documents such as clinic records, reports, and literature will be analyzed to extract relevant information.

Storytelling Technique. The researchers will use storytelling as a technique to communicate findings and insights in a compelling and understandable manner.

d. Models

For illustrating the system flow, the researchers will use the following models:

Use Case Model. This model will depict the interactions between user (actors) and the system, showing the various use cases and scenarios.

Class Model. The class model will represent the system's objects, their properties, and the relationships between them, providing a high-level view of the system's structure.

Entity-Relationship Model. This model will define the entities within the system, their attributes, and the relationships between them, helping to design the database structure.

Relational Model. The relational model will specify how data is organized and stored in tables, along with the relationships between these tables, facilitating database design and implementation.

e. Tools

The researchers will use the following tools in developing the system:

Visual Studio 2022. They will use MS Visual Studio for software development, debugging, and testing.

SQL Server Management Studio. SQL Server Management Studio will be used for managing the database and writing SQL queries.

GitHub. GitHub will be utilized for version control and collaboration among team members.

Figma. Figma will be used for designing the user interface and creating wireframes.

Canva. This tool will be selected for editing images, creating the graph, and customizable templates and design elements to visually represent complex data and concepts.

MS Word. MS Word will be used for documentation and writing project reports.

f. Development Process

The Pet Administration and Wellness System for NDV Pet Lovers Clinic will be developed using the System Development Life Cycle (SDLC), the researchers utilized Rapid Application Development (RAD) methodology, where each step in the system's development process will adhere to the SDLC framework. The project will commence with meticulous planning, identifying the system's needs and potential challenges that could arise during development. Subsequently, the researchers will analyze the collected data and develop requirement models that align with the clinic's business processes. The researchers will then define the requirements by creating detailed illustrations and models. Following this, the implementation phase will begin after thorough system testing and error rectification. Finally, the researchers will deploy the system and take over the system's maintenance to ensure its smooth operation.

Figure 9 : Prototype Model of the Development Process

B. Requirements Analysis

a. Functional Requirements

Functional requirements define what the system should do, detailing the required inputs, the processes it performs, and the expected outputs.

Login. User should be able to log in to the system using default or modified user credentials.

User-Verification. User should be able to enter the verification code.

Appointment Scheduling. The system should allow user to schedule appointments for booking and follow-up pet check-ups, vaccinations, and other services.

Pet Records Management. The system should manage electronic medical records (EMRs) for pets, including details of vaccinations, treatments, and medical history.

Product Management. The system should manage product items, pet food, and other supplies, including stock levels.

Billing and Invoicing. The system should generate bills and invoices for services rendered, allowing for payment processing.

Reporting. The system should provide reports on clinic performance, including appointment summaries, and product status.

Reminder System. The system should have a reminder system to alert staff about upcoming appointments for follow-up check-ups and vaccinations.

Client Management. The system should manage client information, including contact details, pet ownership, and appointment history.

User Management System. The system should manage user accounts for doctors and staffs.

b. Non-Functional Requirements

The non-functional requirement refers on how the system respond. This also show the behavior of the system.

Performance. The system should respond quickly to user interactions, with minimal latency for tasks such as appointment scheduling and record retrieval.

Security. The system should require the user to log-in before using the system.

Account. The system should provide an editable default user account for a single user.

Reliability. The system should be reliable, with minimal downtime and data loss, ensuring that critical functions are available when needed.

Usability. The system should be user-friendly, with an intuitive interface that requires minimal training for the user to navigate and use effectively.

User-Authentication. The system should send a verification code to log-in when password is forgotten.

c. Usability Requirements

A usability requirement describes how the system should have been operated by the user according to their characteristics.

The user should possess a basic understanding of computer operations and be familiar with common computer functionalities such as using a keyboard and mouse, navigating through menus, and managing files.

The user should possess a clear understanding of the operation and functionality of the proposed system.

d. Use Case model

Figure 10 : Business Use Case for PAWS: Pet Administration and Wellness System

Figure 11 : System Use Case for Process Log-In

Use Case Description

Use Case Name	:	Process Log-In User
Purpose	:	To securely authenticate the user and provide access to the system.
Triggering Actor	:	Doctor/Admin and Staff.
Benefitting Actor	:	Doctor/Admin and Staff.
Pre-Condition	:	The doctor/staff wants to access the system.
Post-Condition	:	The doctor/staff successfully accessed the system.

Steps:

Doctor and Staff.	System
1. The user launches the system application.	
2. The user will Input the username and password and click the login button.	

8. The user will input required information to continue and access the system.	3. The system will display the log- in page. 4. Authenticate user's credentials. 5. If the username and/or password is wrong. 5.1 . Error message pop up. 5.2 . Go back to step 2. 6. If the username and/or password is correct 6.1 Successfully logged in. 7. If the username and/or password is correct, and it's the user first login, then: 7.1. Add user info.
---	---

Use Case Description

Use Case Name	:	Request Password
Purpose	:	To request passwords to the administrator
Triggering Actor	:	Doctor/Admin and Staff.
Benefitting Actor	:	Doctor/Admin and Staff.
Pre-Condition	:	The doctor/staff forgot it's password and wants to reset the password.

Post-Condition : The doctor/staff successfully requested the password.

Steps:

Doctor and Staff	System
1. If the user has forgotten their password, they select the "Request Password" option. 3. The user provides their username/ Id number.	2. The system prompts the user to enter their registered username. 4. The system sends a generated password to the admin account. for a temporarily use, then the user will change his/her password.

Use Case Description

Use Case Name : Show Password

Purpose : To show passwords in the box to type passwords correctly.

Triggering Actor : Doctor/Admin and Staff.

Benefitting Actor : Doctor/Admin and Staff.

Pre-Condition : The doctor/staff wants to see the password input to the password inbox.

Post-Condition : The system shows the password input.

Steps:

Doctor and Staff	System
1. The user selects the "Show Password" option.	2. The system displays the entered password in plain text, allowing the user to verify the correctness of their input.

Figure 12 : System Use Case for Process Log-Out

Use Case Description

Use Case Name : Log-Out User
Purpose : To log-out user
Triggering Actor : Admin and Staff

Benefitting Actor : Admin and Staff

Pre-Condition : The user wants to log-out

Post-Condition : The user has logged out

Steps:

Admin and Staff	System
1. The user clicks “log-out”	2. The user has logged out

Figure 13 : System Use Case for Process Profile

Use Case Description

Use Case Name : Process Profile

Purpose : To manage the user's account settings and information.

Benefitting Actor : Doctor and Staff

Benefitting Actor : Doctor and Staff

Pre-Condition : The user wants to view profile.

Post-Condition : The user viewed the profile.

Steps:

Doctor and Staff	System
1. The user accesses the profile settings section of the system. 4. Select option.	2. The system displays the user's profile information, including username, and account details. 3. The system Display Option: A. Change Password B. Edit Profile 5. If option = A, then: 5.1. Change password 6. Else if option = B, then: 6.1. Edit Profile

Use Case Description

Use Case Name	: Change password
Purpose	: To change account password
Triggering Actor	: Admin and Staff
Benefitting Actor	: Admin and Staff
Pre-Condition	: The user wants to change the password.

Post-Condition : The user changed the password.

Steps:

Admin and Staff	System
1. Click the change password	
	2. The system prompts the user to enter the current password and the new desired password.
3. The user provides the required information.	
	4. The system verifies the current password and updates the user's password.
	5. The system displays a confirmation message indicating that the password has been successfully changed.

Use Case Description

Use Case Name : Edit profile

Purpose : To edit user information

Triggering Actor : Admin and Staff

Benefitting Actor : Admin and Staff

Pre-Condition : The user wants to edit user information.

Post-Condition : The user edited profile information.

Steps:

Admin and Staff	System
1. The user selects the "Edit Profile" option within the "Profile". 3. The user modifies the desired fields. 4. The user selects the "Save" option to update the information.	2. The system presents a form with the user's current information. . 5. The system validates the changes and updates the user's information. 6. The system displays a confirmation message indicating that the information has been successfully updated.

Figure 14 : System Use Case for Process Appointments

Use Case Description

Use Case Name : Appointments Booking

Purpose	:	To visit and add Booking
Triggering Actor	:	Doctor and staff
Benefitting Actor	:	Doctor and staff
Pre-Condition	:	To add booking and view listed schedules for booking
Post-Condition	:	Visited Booking Page

Steps:

Admin and Staff	System
1. The user selects the "Booking" tab within the "Appointments".	
3. The user Books a schedule for the client	2. The system displays the Booking page.
4. The user fills up the booking details.	.
5. The user selects the "Create" option to add booking.	4. The system displays a prompt that an appointment has been created successfully.
	5. The system displays the certain actions within each Client Booking list.
	A. Register (Admin)
	B. Update

8. Select option	C. Cancel 9. 1. If option = A, then: 9.1 The system will register Client. Else if option = B, then: 9.2 The system will update booking details. . Else if option = C, then: 9.3 The system will cancel the booking.
------------------	--

Use Case Description

Use Case Name	:	Appointments Follow-up
Purpose	:	To visit Follow-up Booking
Triggering Actor	:	Doctor
Benefitting Actor	:	Doctor
Pre-Condition	:	To view listed follow-up pet checkups
Post-Condition	:	Visited Follow-up page

Steps:

Doctor	System
1. The user selects the "Follow-Up" tab within the "Appointments".	2. The system displays the Follow-Up page. 3. The system Displays the certain actions within each Client Follow-Up List. A. Attend

4. Select option	B. Cancel 5. If option = A, then: 9.4 The system will notify successful visit and proceed to check-up form with service provided from recent check-ups. Else if option = B, then: 9.5 The system cancels appointment.
------------------	--

Use Case Description

Use Case Name	:	Appointments Monitoring
Purpose	:	To visit monitoring page
Triggering Actor	:	Doctor and staff
Benefitting Actor	:	Doctor and staff
Pre-Condition	:	To monitor appointments reports
Post-Condition	:	Monitor appointments reports

Steps:

Admin and Staff	System
1. The user selects the "Monitoring" tab within the "Appointments".	2. The system presents the monitoring page.

3. The user selects report type, date range, customs, and status. 4. The user clicks the "View" button.	. 5. The system displays the appointment reports of with the provided selection order.
---	--

Figure 15 : System Use Case for Process Client Record

Use Case Description

Use Case Name	:	Process New Client
Purpose	:	To add new client
Triggering Actor	:	Doctor

Benefitting Actor : Doctor

Pre-Condition : The Doctor has necessary permission to add new clients

Post-Condition : The new client is added to the system's client records

Steps:

Doctor	System
1. The user clicks "Process New Client"	2. Prompts Doctor to enter details Client information, Pet Information
3. Fills in required information and click create button and submit the form	4. System successfully created new Client and shows it in Client Dashboard

Use Case Description

Use Case Name : Edit Client Profile

Purpose : To edit client profile

Triggering Actor : Doctor

Benefitting Actor : Doctor

Pre-Condition : The Doctor has necessary permission to edit client profile in the Client Records

Post-Condition : The selected Client is updated, and changes reflected in the client details

Steps:

Doctor	System
1. The user clicks “Edit Client Profile” 3. Makes necessary changes	2. The system display “Edit Client Profile” form 4. System successfully updated client detail information

Use Case Description

Use Case Name	:	View Pet List
Purpose	:	To view all pet list
Triggering Actor	:	Doctor
Benefitting Actor	:	Doctor
Pre-Condition	:	The Doctor has necessary permission to view all pet list
Post-Condition	:	Displays a form to view pet list

Steps:

Doctor	System
1. The user clicks “View Pet List”	2. The system display a list of existing Pet

Use Case Description

Use Case Name	:	Process Pet
Purpose	:	To add new pet
Triggering Actor	:	Doctor
Benefitting Actor	:	Doctor
Pre-Condition	:	The Doctor has necessary permission to add new pet for specific clients
Post-Condition	:	The new pet is added to the system’s client records

Steps:

Doctor	System
1. The user clicks “Add New Pet” within the selected client record 2. Doctor to enters new added pet details	3. System successfully created new Pet

Use Case Description

Use Case Name	:	Update Pet
Purpose	:	To update pet
Triggering Actor	:	Doctor

Benefitting Actor : Doctor

Pre-Condition : The Doctor has necessary permission to update client pet information in the Client Records

Post-Condition : The pet is updated, and changes reflected in the pet details

Steps:

Doctor	System
1. The user clicks "Update"	2. The system display "Update Pet" form
3. Makes necessary changes	4. System successfully updated Pet detail information.

Use Case Description

Use Case Name : View History

Purpose : To view history of pet check-ups and diagnosis

Triggering Actor : Doctor

Benefitting Actor : Doctor

Pre-Condition : The Doctor has necessary permission to monitor pet check-ups and diagnosis

Post-Condition : Displays page for pet check-up and diagnosis history

Steps:

Doctor	System
1. The user clicks “History”	2. The system display list of diagnosis history services, date
3. The user clicks “View”	4. The system display pet check-up and diagnosis details

Figure 16 : System Use Case for Process Client Record

Use Case Description

Use Case Name : Process New Product

Purpose : To add new product

Triggering Actor : Doctor and Staff

Benefitting Actor : Doctor and Staff

Pre-Condition : The Doctor has necessary permission to add new products

Post-Condition : The new product is added to the product records

Steps:

Doctor and staff	System
1. The user clicks “Add” within the Product Records 3. Fills in required information and click create button	2. The system displays the form to enter and fill details Category, Product Name, Supplier Price, Price, and Quantity. 4. System successfully created new Product and shows it in Product Dashboard

Use Case Description

Use Case Name : Update Product

Purpose : To edit Product

Triggering Actor : Doctor and Staff

Benefitting Actor : Doctor and Staff

Pre-Condition : The user wants to update product in the Product Records

Post-Condition : The selected product is updated, and changes reflected in the product details.

Steps:

Doctor and Staff	System
1. The user clicks “Update” to the selected product	2. The system display “Edit Product” form
3. Makes necessary changes to the product and clicks “Save”	4. System successfully updated product detail

Use Case Description

Use Case Name : View Stock Adjustments

Purpose : To review inbound and outbound of stock adjustments

Triggering Actor : Doctor and Staff

Benefitting Actor : Doctor and Staff

Pre-Condition : The user want to view stock adjustments

Post-Condition : Displays page for stock adjustments summary

Steps:

Doctor	System
1. The user clicks “Stock Adjustments” within the “Product Record”	

	2. The system display the summary of Stock Inbound and Outbound details Date, Name, Source, and Quantity updates
--	--

Use Case Description

Use Case Name	:	View Category
Purpose	:	To view product category page and add new categories
Triggering Actor	:	Doctor and Staff
Benefitting Actor	:	Doctor and Staff
Pre-Condition	:	The user wants to visit Product category
Post-Condition	:	Displays page for stock adjustments summary

Steps:

Doctor	System
1. The user clicks “View Category” within the “Product Record” 3. The user clicks “Add Category”	2. The system displays the Category dashboard page 4. The system displays the form to enter and fill details

5. The user fills in the form and clicks create	Category name, description, to be categorized product 6. The system successfully created new product category
---	--

Use Case Description

Use Case Name : Update Category

Purpose : To edit Product Category

Triggering Actor : Doctor and Staff

Benefitting Actor : Doctor and Staff

Pre-Condition : The user wants to update product Category from

Product Records

Post-Condition : The category has been updated, and changes reflected in the product category

Steps:

Doctor and Staff	System
1. The user clicks “Update” to the selected category 3. Makes necessary changes to the product and clicks “Save”	2. The system will display update category form 4. System successfully updated category detail

Figure 17 : System Use Case for Process Service

Use Case Description

Use Case Name : Add new Service

Purpose : To add new service

Triggering Actor : Doctor

Benefitting Actor : Doctor

Pre-Condition : The Doctor has necessary permission to add new service

Post-Condition : The new service is added to the system

Steps:

Doctor	System
1. The user clicks “Add new Service” within the Records 3. Fills in required information and click create button	2. The system displays the form to enter and fill details Service Name, Service Charges, Optional Laboratory Test, Optional Follow-up Check-up availability 4. System successfully created new Service and shows it on Services page

Use Case Description

Use Case Name : Update Service

Purpose : To edit Service

Triggering Actor : Doctor

Benefitting Actor : Doctor

Pre-Condition : The user wants to update Service for diagnosis transactions

Post-Condition : The selected service is updated, and changes reflected in the service details

Steps:

Doctor	System
1. The user clicks “Update” to the selected service	
	2. The system will display “Update Service” form
3. Makes necessary changes to the service and clicks “Save”	
	4. System successfully updated service detail

Figure 18 : System Use Case for Process Accounts

Use Case Description

Use Case Name	:	Add Staff
Purpose	:	To add new staff
Triggering Actor	:	Doctor/Admin
Benefitting Actor	:	Doctor/Admin
Pre-Condition	:	Register new staff
Post-Condition	:	Registered a new staff

Steps:

Doctor/Admin	System
1. The doctor/ admin accesses the “Account” section within the “Record” of the system. 3. The administrator selects the "Add User." For registering a new user 5. The administrator fills in the required user information.	2. The system will load and display the user page. 4. The system presents a form providing the auto generated password then for entering user details, such as username, password, and role.

6. The administrator selects the "add" to add the user.	7. The system verifies the entered information and adds the user to the system. 8. The system displays a confirmation message indicating that the user has been successfully added.
---	---

Use Case Description

Use Case Name	:	Account List
Purpose	:	To visit Account List
Triggering Actor	:	Doctor/ Admin
Benefitting Actor	:	Doctor/ Admin
Pre-Condition	:	To view List of staff users
Post-Condition	:	Visited staff user account list

Steps:

Admin	System
2. The administrator selects specific staff from the list.	1. the system will display a list of staff registered in the system 3. The system will display the account list 4. Displayed users have certain actions:

6. Select option	A. Reset B. Activate/Deactivate 7. If option = A, then: 7.1. The system will Reset the staffs account. Else if option = B, then: 7.2. The system will Activate user's account. 7.3. The system will Deactivate user's account.
-------------------------	--

Figure 19 : System Use Case for Process Diagnosis Check-Up

Use Case Description

Use Case Name : Process Diagnosis Check-Up

Purpose : To Create Pet Check-Up Diagnosis

Triggering Actor : Doctor

Benefitting Actor : Doctor

Pre-Condition : The Doctor has necessary permission to
diagnose a pet to the system transactions

Post-Condition : Pet check-up will be created

Steps:

Doctor	System
1. The Doctor clicks “Check-Up” to the Transactions	
	2. The system displays the client search selection Check-up Form
3. The Doctor Searches for the client and click “select”	
	4. The System will display Create Check-up Page with fill up form details Select Pet, Current Weight, Services, Optional Diagnosis Details, Optional Follow-Up Visit
5. The Doctor will Select a Pet, fills up the form details together with the services selected and press “save”	

	6. The system Successfully Created the Check-up and will now be displayed in the billing invoice dashboard
--	---

Figure 20 : System Use Case for Process Purchasing

Use Case Description

Use Case Name	:	Process Purchasing
Purpose	:	To Create Product Purchase
Triggering Actor	:	Doctor and Staff
Benefitting Actor	:	Doctor and Staff
Pre-Condition	:	The user wants to create product purchase
Post-Condition	:	Product Purchases are created

Steps:

Doctor and Staff	System
1. The user clicks “Purchase Product” to the Transactions 3. The user completes purchasing details and click’s “save”	2. The System will display Create Purchase Page for purchasing details Optional Client Name, Add product selection, Quantity 4. The system Successfully Created Purchased product order and will now be displayed in the billing invoice dashboard

Figure 21 : System Use Case for Process Billing Invoice

Use Case Description

Use Case Name : Process Pet Diagnosis Invoice

Purpose : To Process Diagnosis Billing

Triggering Actor : Doctor and Staff

Benefitting Actor : Doctor and Staff

Pre-Condition : The user wants to process Diagnosis Bill

Payment

Post-Condition : The billing has been successfully completed

Steps:

Doctor and Staff	System
1. The user clicks “Billing Invoice” to the Transactions	2. The System will automatically display diagnosis Invoice page that shows ongoing client billings
3. The user clicks “Payment” for selected client invoice	4. The system will proceed to process payment form including billing details and other options A. Modify Service (Can only be accessed by the Doctor) B. Optional Purchase Add-ons C. Payment Billing
5. The user selects an option	

7. The user makes necessary changes to the payment process and completes payment	6. option = A, then: 6.1. The system will display service check-up modifications form Else if option = B, then: 6.2. The system will display purchase additions form Else if option = C, then: The system will display payment billing 8. The payment has been successfully completed
---	--

Use Case Description

Use Case Name	:	Process Product Purchasing Invoice
Purpose	:	To Process Purchase Billing
Triggering Actor	:	Doctor and Staff
Benefitting Actor	:	Doctor and Staff
Pre-Condition	:	The user wants to complete Purchase Bill Payment
Post-Condition	:	The billing has been successfully completed

Steps:

Doctor and Staff	System

1. The user clicks “Payment” for selected purchase invoice	2. The system will proceed to process payment form
3. The user completes purchasing details and click’s “purchase” to confirm	4. The system Successfully completed Product purchase

Figure 22 : System Use Case for Process History

Use Case Description

Use Case Name	:	View Diagnosis History
Purpose	:	To View Diagnosis Transaction History
Triggering Actor	:	Doctor and Staff
Benefitting Actor	:	Doctor and Staff
Pre-Condition	:	The user wants to view diagnosis receipt
Post-Condition	:	The system shows diagnosis transaction receipt

Steps:

Doctor and Staff	System
1. The user clicks “Check-Up” within the Transaction History	2. The system will display list of recent transactions by default
3. The user selects a specific transaction and will click view receipt	4. The system will show diagnosis transaction receipt

Use Case Description

Use Case Name	:	View Purchase History
Purpose	:	To View Purchase Transaction History
Triggering Actor	:	Doctor and Staff
Benefitting Actor	:	Doctor and Staff
Pre-Condition	:	The user wants to view purchase receipt
Post-Condition	:	The system shows purchase transaction receipt

Steps:

Doctor and Staff	System
1. The user clicks “Purchase” within the Transaction History	2. The system will display list of recent transactions by default

3. The user selects a specific transaction and will click view receipt	4. The system will show diagnosis transaction receipt
--	---

Figure 23 : System Use Case for Process Reports

Use Case Description

Use Case Name	:	View Stock Levels Reports
Purpose	:	To view results for Stock Levels
Triggering Actor	:	Doctor and staff
Benefitting Actor	:	Doctor and staff
Pre-Condition	:	The user wants to view stock levels
Post-Condition	:	The system successfully shows stock levels page

Steps:

Doctor and Staff	System
-------------------------	---------------

1. The user clicks “Transaction Summary” 4. The user selects date range 5. The user clicks View button	2. The system will display Transaction Summary page. 3. The system will display an action within the Transaction Summary page to select Date Range. 6. The system successfully presents desired Transaction Summary
---	--

e. Class Model

This section presents the class model, which defines the structure of the system by illustrating the relationships between different classes or objects within the system. It includes attributes, methods, and associations that represent the key elements and behaviors of each class. The Class model represent the graphical structure of the system and it shows the relation between the objects and the classes of the system.

Figure 24 : Diagram for Class Model

f. Entity-Relationship Model

This section presents the Entity-Relationship (ER) model, which illustrates the system's data structure by showing the relationships between different entities in the database. It includes entities, attributes, and relationships, providing a clear visual representation of how data is organized and connected within the system.

Figure 25 : Diagram for ERD

g. Database Schema

This section outlines the database schema, which defines the structure of the database through tables, fields, relationships, and constraints. It provides a detailed view of how data is organized, stored, and accessed within the system, ensuring that data management is efficient and consistent.

Figure 26 : Diagram for Database Schema

h. Implementation Strategies

From the prototyping phase, the researchers moved into the implementation stage, focusing on the full development and deployment of a web-based system. This stage included key steps, including system development, testing, stabilization, and user training. Initially, the researchers concentrated on building and testing core functionalities, enlisting selected testers to validate each function's effectiveness and accuracy. As development progressed, new features were added incrementally, with each tested for stability before the next was introduced. To ensure a stable system, the team conducted rigorous performance evaluations and actively resolved complex issues uncovered during testing, enhancing the system's reliability and robustness. Once the system was fully stabilized, preparations for user training began. The researchers organized a seminar to introduce the system's features and usability. Additionally, they provided both soft and hard copies of the system, ensuring that users had access to the necessary documentation and resources to effectively utilize the web-based system. The implementation phase involved the development, testing, stabilization, and training of users for the web-based system. This comprehensive approach ensured the successful deployment of a stable and user-friendly application to enhance productivity and efficiency within the organization. The outcome was a robust solution designed to enhance productivity and streamline operations across the organization.

i. System User Interface

This section includes screenshots of the PAWS: Pet Administration and Wellness System user interface.

Figure 27 : Log-In

Description: The user interface for the pet clinic login page features a friendly and welcoming design with a pet-themed background and simple, user-friendly login fields, making it easy for users to access their accounts.

Figure 28 : Forgot Password

Description: Forgot Password page invites users to enter their email address to receive a reset code.

Figure 29 : Profile

Description: This User Profile page provides a clean and organized view of the user's account details like account ID, name, email, and contact number with options to edit Info or change password.

Figure 30: Home

Description: The Home dashboard offers an at a glance view of daily stats for bookings, follow-up visits, and low stock levels with a user-friendly layout and a pet-themed sidebar for easy navigation.

Figure 31 : Appointments Booking

Description: The Home dashboard offers an at a glance view of daily stats for bookings, follow-up visits, and low stock levels with a user-friendly layout and a pet-themed sidebar for easy navigation.

Figure 32 : Appointments Follow-up

Description: It provides an organized appointment dashboard for tracking pet follow-ups, with options to manage bookings and monitor attendance efficiently, all in a simple, user-friendly layout.

Figure 33 : Appointments Monitoring

Description: this user interface showing a Monitoring tab for tracking pet follow-up services, with filters for report type, date range, and status, allowing the admin to view and manage appointments effectively.

Figure 34 : Record Management – Client

Description: This User Interface displays a list of registered clients with their contact information and registration date, along with options to add a new client or view the pet list buttons.

Figure 35 : Record Management – Product

Description : This User Interface provides an overview of available products, including medicines and pet foods, with details on price and stock, and options for stock adjustment button.

Figure 36: Record Management – Service

Description : This User Interface lists the available pet services and their charges, with options to add or update services buttons.

Figure 37 : Account – Account List

Description : This user interface displays a list of accounts with details like Account ID, Username, and Date Created, allowing the admin to reset or deactivate accounts.

Figure 39 : Account – Add Staff

Description : This interface provides a simple form for the admin to add new staff members by entering their first and last names, with a button to create the account.

Figure 40 : Transaction – Check-up

Description : This User Interface allows the admin to search for a client by name and view basic details such as name and home address, with an option to select the client for further actions.

Figure 41: Transaction – Purchase Product

Description : User do add products to a purchase list by selecting items, setting quantities, and saving the order, while also showing stock levels, prices, and an option to remove items.

Diagnostic ID	Owner ID - Name	Pet ID - Name	Services	Date	Actions
60005	Angel Abi	Bond	Vaccination	Nov 05, 2024	Modify
60004	Angel Galang	happy	Deworming	Nov 05, 2024	Modify
60003	Angel Galang	happy	Deworming	Nov 05, 2024	Modify
60002	Caltrona Gray	happy	Deworming	Nov 05, 2024	Modify
60000	Angel Abi	Bond	Deworming	Nov 01, 2024	Modify

Figure 42 : Invoice – Diagnosis

Description : It shows a list of diagnostics with details like client name, pet name, service type, and date, along with a payment button for each.

Purchase ID	Customer Name	Date	Total Payment	Actions
30001	Angel	Nov 05, 2024	P800.00	Payment

Figure 43 : Invoice – Purchases

Description : It displays a summary of customer purchases, showing details like Purchase ID, Customer Name, Date, Total Payment, and a button for payment actions.

Transaction History				
All Diagnostics Purchase				
10 entries per page Search:				
Billing Id	Name	Date	Total Payment	Actions
80001	Angel Galiang	Nov 05, 2024	P1,100.00	View Receipt
80000	Angel Abi	Nov 04, 2024	P100.00	View Receipt

Showing 1 to 2 of 2 entries

Figure 44 : Transaction History – All

Description : This section provides an overview of all transactions, categorized by Billing ID, Name, Date, Total Payment, and offers an option to view detailed receipts.

Transaction History				
All Diagnostics Purchase				
10 entries per page Search:				
Billing Id	Name	Date	Total Payment	Actions
80001	Angel Galiang	Nov 05, 2024	P1,100.00	View Receipt
80000	Angel Abi	Nov 04, 2024	P100.00	View Receipt

Showing 1 to 2 of 2 entries

Figure 45 : Transaction History –Diagnostics

Description : This section provides an overview of all transactions, categorized by Billing ID, Name, Date, Total Payment, and offers an option to view detailed receipts.

Billing Id	Name	Date	Total Payment	Actions
80002	Angel	Nov. 05, 2024	P800.00	View Receipt

CHAPTER IV

RESULT AND ANALYSIS

1. I think that I would like to use this product frequently.

20 responses

Figure 49 : System Usability scale for I think that I would like to use this product frequently

The majority of respondents 65% Strongly Agree that they would this product frequently and 5% Agree. 5% of respondents expressed a neutral opinion.

2. I found the product unnecessarily complex.

20 responses

Figure 50 : System Usability scale for I found the product unnecessarily complex

The majority of respondents 60% Strongly Disagree that they found the product unnecessarily complex, 5% Agree, 20% disagree and 5% strongly Agree. 10% of the respondents expressed a neutral opinion.

3. I thought the product was easy to use.

20 responses

Figure 51 : System Usability scale for I thought the product was easy to use

The majority of respondents 60% Strongly Agree that they found they thought the product was easy to use, 20% Agree, and 10% Disagree. 10% of the respondents expressed a neutral opinion.

4. I think that I would need the support of a technical person to be able to use this product.

20 responses

Figure 52 : System Usability scale for I think I would need the support of a technical person to be able to use this product

The majority of respondents 40% Strongly Disagree that they need the support of a technical person to be able to use the system, 30% Disagree, 15% Agree, and 5% Strongly Agree. 10% of the respondents expressed a neutral opinion.

5. I found the various functions in the product were well integrated.

20 responses

Figure 53 : System Usability scale for I found the various functions in the product were well integrated

The majority of respondents 80% Strongly Agree that they found the various functions in the product were well integrated and 20% Agree. No respondents expressed a neutral opinion or Disagree.

6. I thought there was too much inconsistency in this product.

20 responses

Figure 54: System Usability scale for I thought there was too much inconsistency in this product

The majority of respondents 45% Strongly Disagree that they thought there was too much inconsistency in this product, 35% Disagree, 10% Agree. 10% of respondents expressed a neutral opinion.

7. I imagine that most people would learn to use this product very quickly.

20 responses

Figure 55 : System Usability scale for I imagine that most people would learn to use this product very quickly

The majority of respondents 70% Strongly Agree that they imagine that most people would learn to use this product very quickly, 30% Agree. No respondents expressed a neutral opinion or disagree.

8. I found the product very awkward to use.

20 responses

Figure 56 : System Usability scale for I found the product very awkward to use

The majority of respondents 70% Strongly Disagree that they found the product very awkward to use, 20% Disagree, and 15% Agree. No respondents expressed a neutral opinion.

9. I felt very confident using the product.

19 responses

Figure 59 : System Usability scale for I felt very confident using the product

The majority of respondents 73% Strongly Agree that they felt very confident using the product, and 26% Agree. No respondents expressed a neutral opinion or Disagree

10. I needed to learn a lot of things before I could get going with this product.

20 responses

Figure 60 : System Usability scale for I needed to learn a lot of things before I could get going with this product

The majority of respondents 35% Strongly Disagree and 35% Disagree that they needed to learn a lot of things before they could get going with this product, 5% Agree and 5% Strongly Agree. 20% of respondents expressed a neutral opinion.

To assess the system's usability, each of the respondents SUS score was calculated using a formula: $SUS\ Score = (X + Y) \times 2.5$. In this formula, X is the sum of the points for all odd numbered questions minus 5, while Y is calculated as 25 minus the sum of the points for all even numbered questions [6].

The SUS score assesses the system's performance in terms of effectiveness, efficiency, and overall ease of use, offers valuable information on the system's usability.

SUS Score	Grade	Adjective Rating
> 80.3	A	Excellent
68 – 80.3	B	Good
68	C	Okay
51-68	D	Poor
< 51	F	Awful

Table 3: Guidelines of SUS Score

Respondent No.	SUS Score	Grade	Adjective Rating
1	65	D	Poor
2	100	A	Excellent
3	50	F	Worst

4	100	A	Excellent
5	95	A	Excellent
6	82.5	A	Excellent
7	80	B	Good
8	75	B	Good
9	77.5	B	Good
10	95	A	Excellent
11	80	B	Good
12	95	A	Excellent
13	90	A	Excellent
14	90	A	Excellent
15	75	B	Good
16	67.5	D	Poor
17	85	A	Excellent
18	82	A	Excellent
19	100	A	Excellent
20	95	A	Excellent

Table 4: Respondent's Individual SUS Score

This table shows the respondent's individual SUS Score with the corresponding grades and adjective rating. The results of the system show the different responses. Specifically, four respondents rated Excellent, seven respondents rated Good, eight respondents rated Poor and one rated Awful. This suggests that some respondents indicate a positive user experience, while others suggesting an area for improvement.

SUS Score	Grade	Adjective Rating
84	A	Excellent

Table 5: Overall SUS Score of Respondents

The System's Usability Scale score was calculated to be 84 by using the SUS score formula. The score falls under the "Excellent" range for usability. Overall, the results indicate a positive evaluation of the system's usability.

CHAPTER V

DISCUSSION OF RESULTS

The results of the user acceptance survey provide valuable insights into the usability and perceived effectiveness of the Pet Administration and Wellness System. Overall, the system was well-received by users, with positive ratings of usability. The majority of respondents found the system easy to use and intuitive. They indicated that the various functions were well-integrated, and the system required minimal learning effort. This suggests that the system's interface and design were effective in guiding users through the various tasks. The system was perceived as relatively simple, with a low level of perceived complexity. Users expressed confidence in using the system, indicating that they felt comfortable navigating the interface and performing required tasks. While the overall user experience was positive, there are a few areas where improvements could be made. Although the system was generally perceived as consistent, a small percentage of users noted some inconsistencies. Ensuring consistency in design and functionality across different features can further enhance the user experience. While most users did not require significant technical support, a small percentage indicated that they would benefit from additional support. Providing clear documentation, facts and questions, or video tutorials can help address this need.

CHAPTER VI

CONCLUSION AND RECOMMENDATIONS

A. Conclusion

According to the study, the researchers discovered that when using their current manual system, they faced issues such as difficulties in finding and retrieving data, errors in data entry, and inefficiencies in appointment scheduling and inventory management. As a result, the researchers believed that implementing the suggested system could resolve these problems. Consequently, the researchers concluded that the PAWS: Pet Administration and Wellness System has the capacity to significantly improve operational efficiency, enhance service quality, and provide valuable insights through data-driven reports.

B. Recommendations

Based on the research conducted, it is recommended that the NDV Pet Lovers Veterinary Clinic actively pursue the implementation and adoption of the proposed web-based PAWS: Pet Administration and Wellness System. This system can streamline operations, reduce errors, and improve overall efficiency. It will provide centralized platform for storing and organizing Records, improving efficiency and accessibility for staff members. The system aims to address these shortcomings of the current system, which suffers from data inaccuracy, slow processing, inefficiency, and inadequate security measures. These problems are effectively handled by the proposed system which supported by the results of the user evaluation, which suggests that all user find the system's provision of information regarding unprotected records are somewhat unsatisfactory. Implement a scheduling system for continuous follow-up pet check-ups, by this feature ensures on-time follow-up care and improve patient outcome. Incorporate a feature for adding pet pictures to records as visual records can aid in identification and provide additional information for medical purposes.

Enhancement of the dashboard to display monthly follow-up and booking schedules to provide a clear overview of upcoming appointments and help prioritize tasks. By following these recommendations, the NDV Pet Lovers Clinic can effectively implement and utilize the PAWS: Pet Administration and Wellness System, maximizing its benefits in terms of record management, improved operation, and enhanced efficiency.

APPENDICES

Appendix A. System Specifications

Hardware Specification

Processor	:	AMD Ryzen 5 5500u with Radeon Graphics 2.10 GHz
RAM	:	16.0 GB (15.3 GB usable)
Motherboard	:	ASUS H1 10M-D
Hard Disk	:	SATA 1 TeraByte Seagate 7200rpm
Mouse	:	A4Tech Optical OP620D Black

Software Specification

Operation System	:	Windows 11 Home Single Language
Database	:	MySQL
OS Build	:	22631.4317

Appendix B. Flow of the System

Current Flow of the System

Figure 61 : All Transactions of the Current System

Figure 62 : Scheduling appointments of the Current System

Currently, NDV Pet Lovers Clinic still uses a traditional method where all data entry are done manually and records stored in papers. There is always some manual implication when clients arrive, as their information has to be entered. Paper charts and bookshelves are back to storing patients' medical records, booking and follow-up checkups are checked on a notebook as everything is manually scheduled. It is manual entry for tracking inventory and billing which results in a process which sometimes end up with errors, inefficiencies or possible information loss.

Proposed Flow of the System

Figure 63 : Proposed Flow of the System

The goal of the proposed PAWS system is to increase productivity and streamline processes. Medical documents will be kept in the system's record, appointments will be digitally scheduled and tracked, and clients and pets will be registered in the system's record. Automated billing and inventory management will be implemented. The technology will also produce a variety of reports to aid in decision-making. PAWS will

increase overall service quality, decrease errors, and improve accuracy by automating these procedures.

Appendix C. Application Prototype

The prototype showcases the initial design, core functionality, and user interface of PAWS: Pet Administration and Wellness System. It provides a clear visualization of how users will interact with the system, highlighting key features such as event management, menu planning, client communication, and staff scheduling. By offering a comprehensive overview of "Seamless Service," this prototype ensures the system's intended usability and alignment with Red Carpet Catering Services' objectives before full-scale implementation.
